

FUSRAP – St. Louis Downtown Site

PROPOSED PLAN

for Inaccessible Soils Operable Unit – Group 1 Properties

U.S. Army Corps of Engineers
St. Louis District

The U.S. Army Corps of Engineers (USACE), St. Louis District, issued a Proposed Plan on January 3, 2014 identifying the preferred remedy for the Inaccessible Soils Operable Unit (ISOU) – Group 1 Properties. The Proposed Plan recommends no further action for the inaccessible areas of the Group 1 Properties. This recommendation is based on the results of a Remedial Investigation and Baseline Risk Assessment Report published in September 2012. The Report indicated the risk due to FUSRAP contamination did not exceed the USEPA's acceptable risk range at the Group 1 properties.

Public Participation

USACE encourages the public to comment on the preferred remedy presented in the Proposed Plan to ensure the remedy meets the needs of the community and is an effective solution. The final remedy will not be selected until after full consideration of all public comments. The final remedy will be documented in a Record of Decision for the ISOU – Group 1 Properties.
