B-1.0 INTRODUCTION

B-1.1 DESCRIPTION

This Quality Control Summary Report (QCSR) was performed on the soil samples taken for the IAAAP Remedial Investigation for Line 1, Firing Sites Area, Yards C, G, L, Warehouse 3-01 and West Burn Pads. The sampling was conducted in accordance with the IAAAP RI Work Plan.

B-1.2 OBJECTIVES

The intent of the QCSR is to document the usability of the data based on project Data Quality Objectives (DQO's), precision, accuracy, representiveness, comparability, completeness, and sensitivity.

B-1.3 IMPLEMENTATION

SAIC sampling was conducted from May 1999 to November 2007. Radiological analyses were conducted by the on-site FUSRAP laboratory at HISS with QA split samples being analyzed by Test America/formerly Severn-Trent Laboratories. Chemical analyses were conducted offsite by Test America/formerly Severn-Trent Laboratories with QA split samples being analyzed by USACE-ERDC, Vicksburg, Mississippi Laboratory.

B-1.4 PURPOSE

The primary intent of this assessment is to illustrate that data generated for these samples can withstand scientific scrutiny, are appropriate for their intended purpose, are technically defensible, and are of known and acceptable sensitivity, precision, and accuracy.

B-2.0 QUALITY ASSURANCE PROGRAM

A Quality Assurance Project Plan (QAPP) was developed for this project and is part of the IAAAP RI Work Plan. The QAPP established requirements for both field and laboratory QC procedures. An analytical laboratory QC duplicate sample, laboratory control sample (LCS), and a method blank were required for every 20 field samples of each matrix and analyte. For non-radiological analysis (i.e. inorganics/metals, or organics) a matrix spike sample (MS), matrix spike duplicate (MSD), or laboratory control sample/laboratory control sample duplicate is also required.

A primary goal of the QA program was to ensure that the quality of results for environmental measurements was appropriate for their intended use. To this end, a QAPP and standardized field procedures were compiled to guide the investigation. Through the process of readiness review, training, equipment calibration, QC implementation, and detailed documentation, the project has successfully accomplished the goals set by the QA Program.

EPA "definitive" data has been reported including the following basic information:

- Laboratory case narratives
- Sample results
- Laboratory method blank results
- Laboratory control standard results
- Laboratory duplicate sample results
- Tracer recoveries
- Sample extraction dates
- Sample analysis dates

This information supplied to the SAIC Data Management Group from the laboratory provides the basis for an independent data evaluation relative to precision, accuracy, representativeness, completeness, and sensitivity. These parameters are presented in Section B-4.0.

B-3.0 DATA VALIDATION

This project implemented the use of data validation checklists to facilitate laboratory data validation. These checklists were completed by the project designated validation staff and were reviewed by the project laboratory coordinator. Data validation checklists or verification summaries for each laboratory sample delivery group have been retained with laboratory data deliverables by Science Applications International Corporation (SAIC).

B-3.1 LABORATORY DATA VALIDATION

Analytical data generated for this project have been subjected to a process of data verification, validation, and review. Several criteria have been established against which the data are compared and from which a judgment is rendered regarding the acceptance and qualification of the data. Because it is beyond the scope of this report to cite those criteria, the reader is directed to the following documents for specific detail:

- *Data Validation* (SAIC 2006).
- *Department of Defense Quality Systems Manual for Environmental Laboratories (DOD 2006).*
- *EM 200-1-6 Department of the US Army Corps of Engineers (USACE 1997).*
- *ER1110-1-263 Department of the US Army Corps of Engineers (USACE 1998).*
- *IAAP Remedial Investigation Work Plan for Line 1, Firing Sites Area, Yards C, G, L, Warehouse 3-01 and West Burn Pads Area South of the Road, Appendix D Quality Assurance Project Plan (USACE 2007).*
- *USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy* (USACE 2002c).

Upon receipt of field and analytical data, verification staff performed a systematic examination of the reports to ensure the content, presentation, and administrative validity of the data, as set out in the IAAAP RI Work Plan QAPP. In conjunction with data package verification, laboratory electronic data deliverables were available. These data deliverables were subjected to review and verification against the hardcopy deliverable. Both a structural and technical assessment of the laboratory-delivered electronic reports were performed. The structural evaluation verified that required data had been reported and contract specified requirements were met (i.e., analytical holding times, contractual turnaround times, etc.).

During the validation phase of the review and evaluation process, data were subjected to a systematic technical review by examining the field results, analytical QC results, and laboratory documentation following appropriate guidelines, provided in the above referenced documents. These data validation guidelines define the technical review criteria, methods for evaluation of the criteria, and actions to be taken resulting from the review of these criteria. The primary objective of this phase was to assess and summarize the quality and reliability of the data for the intended use and to document factors that may affect the usability of the data. Data verification/validation included but was not necessarily limited to the following parameters:

- Requirements for Methods:
  - Holding time information and methods requested
  - Discussion of laboratory analysis, including any laboratory problems, i.e. the Case Narrative for the associated Sample Delivery Group(s).

- Radiochemical Analysis
  - Sample results
  - Initial calibration
  - Efficiency check
  - Background determinations
  - Spike recovery results
  - Internal standard results (tracers or carriers)
  - Duplicate sample results
  - Self-absorption factor (for alpha and beta radioactivity)
  - Cross-talk factor (during simultaneous detection of alpha and beta radioactivity)
  - Laboratory control samples (LCSs)
  - Run log
- Inorganic Analysis
  - Sample Results
  - Initial Calibration Verification
  - Continuing Calibration Verification
  - Initial Calibration Blank
  - Continuing Calibration Blank
  - Method Blank
  - Matrix Spike and Matrix Spike Duplicate
  - Laboratory Control Samples
  - Preparation Log
  - Run Log
- Organic Analysis
  - Sample Results
  - Initial Calibration
  - Initial Calibration Verification
  - Continuing Calibration Verification
  - Method Blank
  - Internal standard results
  - Surrogate standard Results
  - Matrix Spike and Matrix Spike Duplicate
  - Laboratory Control Samples
  - Preparation Log
  - Run Log

As an end result of this phase of the review, data were qualified based on the technical assessment of the validation criteria. Qualifiers were applied to each analytical result to indicate the usability of the data for its intended purpose with a reason code to explain the retention or the qualifier.

B-3.2 DEFINITION OF DATA QUALIFIERS

During the data validation process, all laboratory data were assigned appropriate data validation qualifers (VQs) and reason codes, as follows:

"=" Positive result was obtained.

"U" When the material was analyzed for a COC, but it was not detected above the level of the associated value.

"J" When the associated value is an estimated quantity, indicating a decreased knowledge of the accuracy or precision of the reported value.

"UJ" When the analyte was analyzed for, but it was not detected above the minimum detectable value, and the reported value is an estimate, indicating a decreased knowledge of the accuracy or precision of the reported value.

"R" When the analyte value reported is unusable. The integrity of the analyte's identification, accuracy, precision, or sensitivity have raised significant question as to the reality of the information presented.

Positive results are to be flagged with a "J" qualifier and non-detect results are to be flagged "UJ", when data quality is suspect due to quality control issues, either blank contamination or analytical interference. None of the laboratory data were assigned an "R" code. SAIC validation qualifiers and reason codes and copies of validation checklists and qualified data forms are filed with the analytical hard copy deliverable.

B-4.0 DATA EVALUATION

The data evaluation process utilizes the PARCCS acronym which stands for Precision, Accuracy, Completeness, Comparability, and Sensitivity. The following sub sections will provide detail to the particular parameters and how the data was evaluated for each with discussion and tables to present the associated data.

Accuracy and precision can be measured by the relative percent difference (RPD) or the normalized absolute difference (NAD) using the following equations:

$$RPD = \left(\frac{|S - D|}{\frac{S + D}{2}} \right) * 100$$

$$NAD = \frac{|S - D|}{\sqrt{U_S^2 + U_D^2}}$$

Where: S = Parent Sample Result
D = Field Split/Duplicate Parent Sample Result
U_S = Parent Sample Uncertainty
U_D = Field Split/Duplicate Parent Sample Uncertainty

The RPD is calculated for all samples, if a detectable result is reported for both the parent and the QA field split or field duplicate. For radiological samples, when the RPD is greater than fifty percent, the NAD is used to determine the accuracy or precision of the method. NAD accounts for uncertainty in the results, RPD does not. Neither equation is used when the analyte in one or both of the samples is not detected. In cases where neither equation can be used, the comparison is counted as acceptable in the overall number of comparisons.

B-4.1 ACCURACY

Accuracy provides a gauge or measure of the agreement between an observed result and the true value for an analysis. Accuracy, as measured through the use of the field split samples, is measured by a comparison of the prime laboratory results versus the results of an independent laboratory.

B-4.1.1 Radiological Parameters

Individual sample LCS recoveries were within the 25 percent criterion for the verification samples, as stated in the QAPP.

B-4.1.2 Inorganic Parameters

Individual sample recoveries were within the 25 percent criterion for the verification samples, as stated in the QAPP.

B-4.1.3 Organic Parameters

Explosive Parameters

Individual sample LCS recoveries were within the -35 to + 42 for 1,3,5-Trinitrobenzene and RDX, -35 to +38 for TNT, -35 to +47 for HMX, and 35 for 2,4-Dinitrotoluene percent criterion for the verification samples, as stated in the QAPP.

PCB Parameters

Individual sample LCS recoveries were within the 25 percent criterion for the verification samples, as stated in the QAPP.

SVOC Parameters (including PAHs)

Individual sample LCS recoveries were within the -70 to +40 percent criterions for the verification samples, as stated in the QAPP.

B-4.1.4 Inter-Laboratory Accuracy

As a measure of analytical accuracy, relative percent differences (RPD) for split sample pairs for two radiological analytical groups (i.e., alpha spectroscopy and gamma spectroscopy) were employed and analyzed by the FUSRAP laboratory at HISS and Test America/formerly Severn Trent Laboratories. Analytical accuracy of chemical analysis were evaluated for split sample pairs that were analyzed by the Test America/formerly Severn Trent Laboratories and USACE-ERDC, both analyzed for Explosives, Semi-Volatile Organic Compounds (including PAHs), Metals, and PCBs. The ability to compare the results from the laboratories is subject to several factors, such as sample homogeneity, analytical methods, volume of sample, and for radiological samples the size of the uncertainty (reported as error) relative to the result (e.g., a low result near the detection limit may have an uncertainty close to or even higher than the result itself). Accuracy is impacted by a large relative uncertainty in the result. Large relative uncertainties often occur in results close to the minimum detectable concentration, which frequently occurred for sample results discussed in this report.

The analytical accuracy between laboratories met the QAPP goal of ensuring that 80 percent of the samples were within the DQOs. For all analysis, the sample results comparison must be less than the 50 percent criteria for RPD, or be less than 1.96 NAD for radiological analytes, to be within the DQOs. There are a total of 1286 individual comparisons for the 118 requested analytes and 19 possible sample and sample split pairs available. Of those comparisons, 58 metal comparisons, 5 explosive comparisons, and 42 semi-volatile organic comparisons exceeded the 50 percent criteria for the RPD. One hundred fifty-five comparisons, or 12.05 percent, exceeded the criteria as demonstrated in Table B-1, Table B-2, Table B-3 and Table B-4. The data set meets the QAPP goal of 80 percent acceptance, is therefore, acceptable.

Table B-1. Split Sample Accuracy among Alpha Spectroscopy Analyses

Sample Name	Th-228		Th-230		Th-232	
	RPD	NAD	RPD	NAD	RPD	NAD
IAAP96830 / IAAP96830-2	*	*	*	*	*	*

Sample Name	U-234		U-235		U-238	
	RPD	NAD	RPD	NAD	RPD	NAD
IAAP104386 / IAAP104386-2	*	*	*	*	*	*
IAAP104409 / IAAP104409-2	*	*	*	*	*	*
IAAP104427 / IAAP104427-2	*	*	*	*	*	*
IAAP96830 / IAAP96830-2	*	*	*	*	*	*

Notes: NAD Calculated for additional information when RPD greater than 30 percent.
Boldface Values exceed the control limits. Values not in boldface are within control limits.
* Not calculated because either parent or split sample was not analyzed
NC — Value cannot be calculated since the radionuclide was not detected in one or both of the samples, or the RPD value was less than 50 percent.

Table B-2. Split Sample Accuracy among Gamma Spectroscopy Analyses

Sample Name	Ac-227		Am-241		Cs-137		K-40		Pa-231		Ra-226		Ra-228		Th-228		Th-230		Th-232		U-235		U-238

Notes: Boldface – Values exceed the control limits. Values not in boldface are within control limits.
* — Not calculated because either parent or duplicate sample was not analyzed
NC – Value not calculated since the analyte was not detected in one or both of the samples.
Other analytes were analyzed for but for consciences with in the table only detected analytes are presented.

B-4.2 PRECISION

B-4.2.1 Analytical Precision

Precision is a measure of mutual agreement among individual measurements performed under the same laboratory controls. To evaluate for precision a field duplicate is submitted to the same lab as the original sample to be analyzed under the same laboratory conditions. If any bias is introduced at the prime laboratory that bias would affect both samples equally To evaluate precision within the on-site laboratory, duplicate samples were employed at a frequency of one duplicate sample per 20 samples taken in the field at any given sampling event.

As a measure of analytical precision, the RPDs for these duplicate sample pairs for the two radiological analytical groups (i.e., alpha spectroscopy and gamma spectroscopy) were calculated at the time of verification and validation. RPD (and/or NAD for Radiological) values for all analytes are within the 50 percent window (less than 1.96 for NAD Radiological) of acceptance for the verification samples, except where noted.

B-4.2.2 System Precision

The field duplicate samples were collected to ascertain the contribution to variability (i.e., precision) due to the combination of environmental media, sampling consistency, and analytical precision that contribute to the precision for the entire system of collecting and analyzing samples. The field duplicate samples were collected from the same spatial and temporal conditions as the primary environmental sample. Soil samples were collected from the same sampling device, after homogenization for all analytes.

There are a total of 1286 individual comparisons for the 118 requested analytes and 19 possible sample and sample duplicate pairs available. Of those comparisons, 23 metal comparisons, 5 explosive comparisons, and 36 semi-volatile organic comparisons exceeded the 50 percent criteria for the RPD. Sixty-four, or 4.98 percent, exceeded the criteria, as demonstrated in Table B-5, Table B-6, Table B-7, and Table B-8. The data set meets the QAPP goal of 80 percent acceptance, are therefore, acceptable.

Table B-5. Duplicate Precision among Alpha Spectroscopy Analyses

Sample Name	Thorium-228		Thorium-230		Thorium-232	
	RPD	NAD	RPD	NAD	RPD	NAD
IAAP96830 / IAAP96830-1	39.24	NC	44.21	NC	4.63	NC

Sample Name	Uranium-234		Uranium-235		Uranium-238

Notes: Boldface – Values exceed the control limits. Values not in boldface are within control limits.
* — Not calculated because either parent or duplicate sample was not analyzed
NC – Value not calculated since the analyte was not detected in one or both of the samples.
Other analytes were analyzed for but for consciences with in the table only detected analytes are presented.

B-4.3 REPRESENTATIVENESS AND COMPARABILITY

Representativeness expresses the degree to which data accurately reflect the analyte or parameter of interest for an environmental site and is the qualitative term most concerned with the proper design of a sampling program. Factors that affect the representativeness of analytical data include proper preservation, holding times, use of standard sampling and analytical methods, and determination of matrix or analyte interferences. Sample holding time (measured from sample collection to preparation and/or analysis), Sample preservation, analytical methodologies, and soil sampling methodologies were documented to be adequate and consistently applied.

Comparability expresses the confidence with which our data set can be compared with another. These investigations employed appropriate sampling methodologies, site surveillance, use of standard sampling devices, uniform training, documentation of sampling, standard analytical protocols/procedures, QC checks with standard control limits, and universally accepted data reporting units to ensure comparability to other data sets. Through the proper implementation and documentation of these standard practices, the project has established the confidence that the data will be comparable to other project and programmatic information.

Table B-9 through Table B-12.3 contain the results used to compare sample results from the duplicate and split samples to the associated parent sample. In Table B-10, the Ra-226 results from the independent laboratory have been adjusted upward by a factor of 1.5, for all samples analyzed after 20 February 2007, to provide proper comparability. The adjustment is necessary since the Ra-226 results reported by the FUSRAP Laboratory automatically include a factor of 1.5 to conservatively account for Ra-226 in-growth. The independent laboratory does not include a factor to account for Ra-226 in-growth. The definitions for the qualifiers presented are found on pages B-6 and B-7.

Table B-9. Alpha Spectroscopy Results for Parent Samples and associated Split and Duplicate Samples

Sample Name	Thorium-228				Thorium-230				Thorium-232

B-4.4 COMPLETENESS

Usable data are defined as those data, which pass individual scrutiny during the verification and validation process and are accepted for their intended use. The DQO of achieving eighty percent completeness, as defined in the IAAAP RI QAAP was satisfied with the project producing valid results for 100 percent of the sample analyses performed and successfully collected.

A total of 921 soil samples were collected with approximately 27,673 discrete analyses being obtained, reviewed, and integrated into the assessment. The project produced acceptable results for 100 percent of the sample analyses performed.

B-4.5 SENSITIVITY

Determination of minimum detectable concentrations (MDC) values allows the investigation to assess the relative confidence that can be placed in a value in comparison to the magnitude or level of analyte concentration observed. For this report, MDC is used to combine both the method detection limit (MDL) for metals, PCBs, semi-volatiles, and explosives with minimum detectable activity for radiological analytes. The closer a measured value comes to the MDC, the less confidence and more variation the measurement will have. Project sensitivity goals were expressed as MDL in the IAAAP RI Work Plan QAPP Appendix D. These levels were achieved or exceeded throughout the analytical process.

The MDC is reported for each result obtained by laboratory analysis. These very low MDCs are achieved through the use of gamma spectroscopy for all radionuclides of concern, with additional analyses from alpha spectroscopy for thorium and uranium, GC-MS for semi-volatile organics, HPLC for explosives, ICP-AES for metals, and CVAA for mercury. The varying MDCs for the same analyte reflects variability in the detection efficiencies and conversion factors due to influences such as individual sample aliquot, sample density, and variations in analyte background radioactivity for gamma and alpha spec, at the laboratory. Then varying MDC's for all chemical analysis for same analyte reflects variability in calibrations between laboratories, dilutions, and analytical methods. In order to complete the Data Evaluation (i.e. Precision, Accuracy, Representativeness, and Comparability), analytical results are desired that exceed the MDC of the analyte.

B-5.0 DATA QUALITY ASSESSMENT SUMMARY

The overall quality of this data meets or exceeds the established project objectives. Through proper implementation of the project data verification, validation, and final assessment process, project data has been determined to be acceptable for use.

Sample data, as presented, have been qualified as usable, but estimated when necessary. Data that have been estimated have concentrations/activities that are below the quantitation limit or are indicative of accuracy, precision, or sensitivity being less than desired but adequate for interpretation. Comparisons that have exceeded the requirements have bolded type. There are numerous possibilities for these anomalies:

- Dilution of samples due to high analyte concentration that exceeds analytical calibration,
- Excessive dilution for sample turbidity or other matrix issues that a laboratory analysis deemed necessary ,
- Incomplete sample homogenization either at the laboratory or during the field sampling
- Matrix interferences within the sample itself that caused inadequate analytical quantitation,
- Different preparation methods for the sample at different laboratories,
- Different analytical methods for the samples at different laboratories,
- Low concentration of the analyte for the calibration range, or near the method detection limit for that analyte, etc.

Further analysis of the data can display trends or even randomness within the data set that could be explained with one or more of the above mentioned contributors to anomalies. For instance, a single sample analyzed at two different laboratories that shows the RPD was not met for any analyte; this could be an indicator of incomplete homogenization in the field, matrix effects in the sample, different preparation methods, dilutions that were required to overcome sample concentration, or analyte concentrations approaching the method detection limit. For example, sample IAAP101791 displays a tendency from both the primary and QA lab of the previous mentioned instance for metals analysis. The same analyte within a sample while other analytes are within specifications could be a simple matrix effect causing poor quantitation of a sample or low concentration of the actual analyte, for example chromium and many of the samples approaches the MDC. If a lab has numerous out of specification data for a specific analyte versus another lab; preparation of the sample could be suspect between labs or even equipment calibration for the specific analyte could be called into question. Laboratory data that shows exceeded RPD for a sample pair analyzed in the same lab but none for the same analyte sample pairing when compared to another lab could be attributed to randomness of quantitation within the analysis. The DoD QSM defines allowable marginal exceedances as 10 percent of the total analysis for random anomalies that occur during regular laboratory analysis. As presented in this report there are 2,572 total comparisons with 219 exceedances for a total of 8.5 percent exceedance, well within the DoD QSM allowance. The requirements for the project have been met for 80 percent of the data to be acceptable, which does allow for some noticeable trends and randomness of anomalous exceedance between laboratories.

Data produced for this QCSR demonstrates that it can withstand scientific scrutiny, are appropriate for its intended purpose, are technically defensible, and are of known and acceptable sensitivity, precision, and accuracy. Data integrity has been documented through proper implementation of QA and QC measures. The environmental information presented has an established confidence, which allows utilization for the project objectives and provides data for future needs.

Radiological Data Validation Reports

DATA VALIDATION REPORT

	Date: **May 25, 2001**
To: **Ron Frerker**	*From:* **V. Samargian**
Laboratory: **FUSRAP Laboratory**	*SDG #:* **01ML260**

Attached you will find the results from the data validation technical review for the FUSRAP samples and analyses that are associated with the above referenced laboratory and sample delivery group (SDG) number. These data points have been selected for data validation and the sample index on the following page specifically identifies the samples and analyses associated with this validation review.

The FUSRAP validation technical review was performed in accordance with the *Laboratory Data Validation Guidelines For Evaluating Radionuclide Analyses and Radiochemical Data Verification and Validation*. It was based on the information and documentation supplied by the associated laboratory. The analyses were evaluated against criteria established in the related analytical procedures and the FUSRAP data quality requirements.

Attachment A to this report provides the Sample Data Summary Sheets for the samples associated with the above referenced request. These summary sheets identify the analytical values and the qualifiers for each sample and parameter. Attachment B outlines the validation qualifiers and reason codes used in the validation of the data.

Report Summary	
Total Number of Samples	13
Total Number of Data Points	216
Total Number of Rejected Data Points	0
Percent Completeness (approval to rejection ratio)	100%

Sample Index

Laboratory: **FUSRAP Laboratory**	*Date:* **May 25, 2001**
	SDG #: **01ML260**

FUSRAP Sample ID	Target Analyses
IAAP25010	Gamma Scan, Isotopic Uranium
IAAP25011	Gamma Scan, Isotopic Uranium
IAAP25013	Gamma Scan, Isotopic Uranium
IAAP25013-1	Gamma Scan, Isotopic Uranium
IAAP25015	Gamma Scan, Isotopic Uranium
IAAP25016	Gamma Scan, Isotopic Uranium
IAAP25025	Gamma Scan, Isotopic Uranium
IAAP25026	Gamma Scan, Isotopic Uranium
IAAP25027	Gamma Scan, Isotopic Uranium
IAAP25028	Gamma Scan, Isotopic Uranium
IAAP25028-1	Gamma Scan, Isotopic Uranium
IAAP25029	Gamma Scan, Isotopic Uranium
IAAP25030	Gamma Scan, Isotopic Uranium

ANALYTICAL CATEGORY: Radiochemical

- Gamma scan (not the typical twelve reported on FUSRAP work) was determined by gamma spectrometry (ML-001M); and isotopic uranium was determined by alpha spectroscopy (ML-015M)

1. The following items (as applicable) have been addressed during the validation review:

   · sample custody, integrity & preservation
   · sample handling & preparation
   · holding times
   · instrument calibration & performance
   · dilution factors
   · detection limits
   · laboratory background & carry-over
   · overall appearance of the data
   · Quality Control:
     ° calibration checks & background
     ° preparation blanks
     ° laboratory control samples
     ° matrix spike samples
     ° matrix duplicates
     ° field blanks (if available)
     ° field duplicates (if available)

2. The above items were found to be acceptable, except as follows:

   · Laboratory Control Sample

   The recovery for the LCS sample for uranium-235 was above the upper control limit (UCL). Recoveries above the UCL could be the result of poor preparation or instrumentation problems, and may indicate a high bias to the data. Only the positive hits for uranium-235 were qualified with a *J*. The following samples were impacted: IAAP25010, IAAP25011, IAAP25013, IAAP25015, IAAP25016, and IAAP25027.

3. Additional comments:

   · None

FUSRAP Sample Data Summary Sheets

ATTACHMENT B

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2×'s the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5× the CRDL.
J03 Duplicate sample results were <5× the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5× the CRDL.
Q04 Duplicate sample results were <5× the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:
July 3, 2008

To:	From:
Mr. Ron Frerker, USACE District Chemist	**David Lee**

Laboratory:	SDG #:
FUSRAP Laboratory (HISS)	**05ML459**

Attached you will find the results from the data validation technical review for the FUSRAP samples and analyses that are associated with the above referenced laboratory and sample delivery group (SDG) number. These data points have been selected for data validation and the sample index on the following page specifically identifies the samples and analyses associated with this validation review.

The FUSRAP validation technical review was performed in accordance with the *Laboratory Data Validation Guidelines For Evaluating Radionuclide Analyses and Radiochemical Data Verification and Validation* and *USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy*. It was based on the information and documentation supplied by the associated laboratory. The analyses were evaluated against criteria established in the related analytical procedures and the FUSRAP data quality requirements.

Attachment A to this report provides the Sample Data Summary Sheets for the samples associated with the above referenced request. These summary sheets identify the analytical values and the qualifiers for each sample and parameter. Attachment B outlines the validation qualifiers and reason codes used in the validation of the data.

ANALYTICAL CATEGORY: Radiochemical

- Actinium-227, americium-241, cesium-137, potassium-40, proctactinium-231, radium-226, radium-228, thorium-228, thorium-230, thorium-232, uranium-235 and uranium-238 were determined by gamma spectrometry (ML-003); isotopic thorium was determined by alpha spectrometry (ML-005).

1. The following items (as applicable) have been addressed during the validation review:

   · sample custody, integrity & preservation
   · sample handling & preparation
   · holding times
   · instrument calibration & performance
   · dilution factors
   · detection limits
   · laboratory background & carry-over
   · overall appearance of the data
   · Quality Control:
     ° calibration checks & background
     ° preparation blanks
     ° laboratory control samples
     ° field blanks (if available)
     ° field duplicates (if available)

2. The above items were found to be acceptable, except as follows:

   · Blank Contamination

   Uranium-238 was present in the associated method blank at 0.201 ± 0.162 pCi/g. This may indicate that contamination could have been introduced during the laboratory preparation. Those samples where the normalized absolute difference between the sample and the method blank were less than 2.58 were qualified as estimated, *J*, with a reason code F01 for the Uranium-238 results via gamma spectroscopy.

3. Additional comments:

   · None.

FUSRAP Sample Data Summary Sheets

ATTACHMENT B

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:
July 3, 2008

To:	From:
Mr. Ron Frerker, USACE District Chemist	**David Lee**

Laboratory:	SDG #:
FUSRAP Laboratory (HISS)	**05ML460**

Attached you will find the results from the data validation technical review for the FUSRAP samples and analyses that are associated with the above referenced laboratory and sample delivery group (SDG) number. These data points have been selected for data validation and the sample index on the following page specifically identifies the samples and analyses associated with this validation review.

The FUSRAP validation technical review was performed in accordance with the *Laboratory Data Validation Guidelines For Evaluating Radionuclide Analyses and Radiochemical Data Verification and Validation* and *USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy*. It was based on the information and documentation supplied by the associated laboratory. The analyses were evaluated against criteria established in the related analytical procedures and the FUSRAP data quality requirements.

Attachment A to this report provides the Sample Data Summary Sheets for the samples associated with the above referenced request. These summary sheets identify the analytical values and the qualifiers for each sample and parameter. Attachment B outlines the validation qualifiers and reason codes used in the validation of the data.

Report Summary	
Total Number of Samples	10
Total Number of Data Points	132
Total Number of Rejected Data Points	0
Percent Completeness (approval to rejection ratio)	100 %

Sample Index

	Date: **July 3, 2008**

ANALYTICAL CATEGORY: Radiochemical

- Actinium-227, americium-241, cesium-137, potassium-40, proctactinium-231, radium-226, radium-228, thorium-228, thorium-230, thorium-232, uranium-235 and uranium-238 were determined by gamma spectrometry (ML-003); isotopic thorium was determined by alpha spectrometry (ML-005).

1. The following items (as applicable) have been addressed during the validation review:

   · sample custody, integrity & preservation
   · sample handling & preparation
   · holding times
   · instrument calibration & performance
   · dilution factors
   · detection limits
   · laboratory background & carry-over
   · overall appearance of the data
   · Quality Control:
     ° calibration checks & background
     ° preparation blanks
     ° laboratory control samples
     ° field blanks (if available)
     ° field duplicates (if available)

2. The above items were found to be acceptable, except as follows:

   · None.

3. Additional comments:

   · None.

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

FUSRAP Sample Data Summary Sheets

ATTACHMENT B

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:
July 3, 2008

To:	From:
Mr. Ron Frerker, USACE District Chemist	**David Lee**

Laboratory:	SDG #:
FUSRAP Laboratory (HISS)	**05ML464**

Attached you will find the results from the data validation technical review for the FUSRAP samples and analyses that are associated with the above referenced laboratory and sample delivery group (SDG) number. These data points have been selected for data validation and the sample index on the following page specifically identifies the samples and analyses associated with this validation review.

The FUSRAP validation technical review was performed in accordance with the *Laboratory Data Validation Guidelines For Evaluating Radionuclide Analyses and Radiochemical Data Verification and Validation* and *USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy*. It was based on the information and documentation supplied by the associated laboratory. The analyses were evaluated against criteria established in the related analytical procedures and the FUSRAP data quality requirements.

Attachment A to this report provides the Sample Data Summary Sheets for the samples associated with the above referenced request. These summary sheets identify the analytical values and the qualifiers for each sample and parameter. Attachment B outlines the validation qualifiers and reason codes used in the validation of the data.

Report Summary	
Total Number of Samples	13
Total Number of Data Points	160
Total Number of Rejected Data Points	0
Percent Completeness (approval to rejection ratio)	100 %

Sample Index

Laboratory: **FUSRAP Laboratory (HISS)**	*Date:* **July 3, 2008**

ANALYTICAL CATEGORY: Radiochemical

- Actinium-227, americium-241, cesium-137, potassium-40, proctactinium-231, radium-226, radium-228, thorium-228, thorium-230, thorium-232, uranium-235 and uranium-238 were determined by gamma spectrometry (ML-003); isotopic uranium was determined by alpha spectroscopy (ML-015).

1. The following items (as applicable) have been addressed during the validation review:

   · sample custody, integrity & preservation
   · sample handling & preparation
   · holding times
   · instrument calibration & performance
   · dilution factors
   · detection limits
   · laboratory background & carry-over
   · overall appearance of the data
   · Quality Control:
     ° calibration checks & background
     ° preparation blanks
     ° laboratory control samples
     ° field blanks (if available)
     ° field duplicates (if available)

2. The above items were found to be acceptable, except as follows:

   · Blank Contamination

   Radium-228 was present in the associated method blank at 0.189 ± 0.0346 pCi/g. This may indicate that contamination could have been introduced during the laboratory preparation. Those samples where the normalized absolute difference between the sample and the method blank were less than 2.58 were qualified as estimated, *J,* with a reason code F01 for the Radium -228 results via gamma spectroscopy.

   Thorium-228 was present in the associated method blank at 0.189 ± 0.0346 pCi/g. This may indicate that contamination could have been introduced during the laboratory preparation. Those samples where the normalized absolute difference between the sample and the method blank were less than 2.58 were qualified as estimated, *J,* with a reason code F01 for the Thorium-228 results via gamma spectroscopy.

   Thorium-232 was present in the associated method blank at 0.189 ± 0.0346 pCi/g. This may indicate that contamination could have been introduced during the laboratory preparation. Those samples where the normalized absolute difference between the sample and the method blank were less than 2.58 were qualified as estimated, *J,* with a reason code F01 for the Thorium-232 results via gamma spectroscopy.

3. Additional comments:

   · None.

FUSRAP Sample Data Summary Sheets

ATTACHMENT B

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:
July 3, 2008

To:	From:
Mr. Ron Frerker, USACE District Chemist	**Alexis Niemeier**

Laboratory:	SDG #:
FUSRAP Laboratory (HISS)	**06ML546**

Attached you will find the results from the data validation technical review for the FUSRAP samples and analyses that are associated with the above referenced laboratory and sample delivery group (SDG) number. These data points have been selected for data validation and the sample index on the following page specifically identifies the samples and analyses associated with this validation review.

The FUSRAP validation technical review was performed in accordance with the *Laboratory Data Validation Guidelines For Evaluating Radionuclide Analyses and Radiochemical Data Verification and Validation* and *USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy*. It was based on the information and documentation supplied by the associated laboratory. The analyses were evaluated against criteria established in the related analytical procedures and the FUSRAP data quality requirements.

Attachment A to this report provides the Sample Data Summary Sheets for the samples associated with the above referenced request. These summary sheets identify the analytical values and the qualifiers for each sample and parameter. Attachment B outlines the validation qualifiers and reason codes used in the validation of the data.

Report Summary	
Total Number of Samples	13
Total Number of Data Points	238
Total Number of Rejected Data Points	0
Percent Completeness (approval to rejection ratio)	100 %

Sample Index

Laboratory: **FUSRAP Laboratory (HISS)**	*Date:* **July 3, 2008**
	SDG #: **06ML546**

IAAP96831	Gamma Spec, Iso U
IAAP96832	Gamma Spec, Iso U

ANALYTICAL CATEGORY: Radiochemical

- Actinium-227 and proctactinium-231 were determined by gamma spectrometry (ML-003); isotopic thorium was determined by alpha spectrometry (ML-005); radium-226 was determined by alpha spectroscopy (ML-006); gross alpha and gross beta were determined by gross proportional counting (ML-018); settleable solids were determined by an Imhoff cone (ML-020); total uranium was determined by kinetic phosphorescence analyzer (ML-021); and total suspended solids were determined by glass fiber filter (ML-023); pH was determined by electrometric probe (ML-024).

1. The following items (as applicable) have been addressed during the validation review:

· sample custody, integrity & preservation
· sample handling & preparation
· holding times
· instrument calibration & performance
· dilution factors
· detection limits
· laboratory background & carry-over
· overall appearance of the data

· Quality Control:
° calibration checks & background
° preparation blanks
° laboratory control samples
° field blanks (if available)
° field duplicates (if available)

2. The above items were found to be acceptable, except as follows:

· Chemical Yield

The U-232 tracers for various samples of interest exhibited high chemical yield recoveries. Generally, a high yield may cause a low bias of the U-234, U-234, and u-238 activities reported by the laboratory. Positive results for the isotopic thorium data points in the affected samples were qualified with a *J* and a G01 reason code.

3. Additional comments:

· Un-requested analysis

The Laboratory performed Iso-Th for IAAP96830 and IAAP96830-1 to achieve a lower MDA and greater level of confidence in the reported Th-230 results.

ATTACHMENT A

FUSRAP Sample Data Summary Sheets

ATTACHMENT B

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

July 3, 2008

To:	From:
Mr. Ron Frerker, USACE District Chemist	**Alexis Niemeier**

Laboratory:	SDG #:
FUSRAP Laboratory (HISS)	**06ML547**

Attached you will find the results from the data validation technical review for the FUSRAP samples and analyses that are associated with the above referenced laboratory and sample delivery group (SDG) number. These data points have been selected for data validation and the sample index on the following page specifically identifies the samples and analyses associated with this validation review.

The FUSRAP validation technical review was performed in accordance with the *Laboratory Data Validation Guidelines For Evaluating Radionuclide Analyses and Radiochemical Data Verification and Validation* and *USACE Kansas City and St. Louis District Radionuclide Data Quality Evaluation Guidance for Alpha and Gamma Spectroscopy*. It was based on the information and documentation supplied by the associated laboratory. The analyses were evaluated against criteria established in the related analytical procedures and the FUSRAP data quality requirements.

Attachment A to this report provides the Sample Data Summary Sheets for the samples associated with the above referenced request. These summary sheets identify the analytical values and the qualifiers for each sample and parameter. Attachment B outlines the validation qualifiers and reason codes used in the validation of the data.

Report Summary	
Total Number of Samples	8
Total Number of Data Points	167
Total Number of Rejected Data Points	0
Percent Completeness (approval to rejection ratio)	100 %

Sample Index

Laboratory: **FUSRAP Laboratory (HISS)**	*Date:* **July 3, 2008**
	SDG #: **06ML547**

FUSRAP Sample ID	Target Analyses
IAAP96833	Gamma Spec, Iso U
IAAP96834	Gamma Spec, Iso U
IAAP96835	Gamma Spec, Iso U
IAAP96836	Gamma Spec, Iso U
IAAP96837	Gamma Spec, Iso U
IAAP96838	Gamma Spec, Iso U
IAAP96839	Gamma Spec, Iso U
IAAP96848	Gamma Spec, Iso U

ANALYTICAL CATEGORY: Radiochemical

- Actinium-227 and proctactinium-231 were determined by gamma spectrometry (ML-003); isotopic thorium was determined by alpha spectrometry (ML-005); radium-226 was determined by alpha spectroscopy (ML-006); gross alpha and gross beta were determined by gross proportional counting (ML-018); settleable solids were determined by an Imhoff cone (ML-020); total uranium was determined by kinetic phosphorescence analyzer (ML-021); and total suspended solids were determined by glass fiber filter (ML-023); pH was determined by electrometric probe (ML-024).

1. The following items (as applicable) have been addressed during the validation review:

   · sample custody, integrity & preservation
   · sample handling & preparation
   · holding times
   · instrument calibration & performance
   · dilution factors
   · detection limits
   · laboratory background & carry-over
   · overall appearance of the data
   · Quality Control:
   ° calibration checks & background
   ° preparation blanks
   ° laboratory control samples
   ° field blanks (if available)
   ° field duplicates (if available)

2. The above items were found to be acceptable, except as follows:

   · Chemical Yield

   The U-232 tracers for various samples of interest exhibited high chemical yield recoveries. Generally, a high yield may cause a low bias of the U-234, U-234, and u-238 activities reported by the laboratory. Positive results for the isotopic thorium data points in the affected samples were qualified with a *J* and a G01 reason code.

3. Additional comments:

   · Analysis not performed

   Sample IAAP96848 was received requesting isotopic Uranium in addition to Gamma Spectroscopy, but the alpha analysis was not reported due to interferences. This is likely a result of the excess Uranium content within the sample. As a result, IAAP96848 was reanalyzed by Gamma Spectroscopy with an extended count time to achieve a lower MDA for Uranium-238. The Americium-241 was identified erroneously due to elevated counts in the Uranium-238 peak falling within the Americium-241 region of interest. The initial Americium-241 result from the original analysis and the reanalysis results excluding the Americium-241 reanalysis result are presented in the data report.

ATTACHMENT A

ATTACHMENT B

KEY TO THE FUSRAP DATA VALIDATION QUALIFIERS

QUALIFIERS	
=	Indicates that the data met all QA/QC requirements, and that the radionuclide has been positively identified and the associated concentration value is accurate.
U	Indicates that the data met all QA/QC requirements, and that the radionuclide was analyzed for but was not detected above the reported sample quantitation limit.
J	Indicates that the radionuclide was positively identified; the associated numerical value is the approximate concentration of the radionuclide in the sample.
UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:
3 July 2008

UJ	Indicates that the radionuclide was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
N	The analysis indicates the presence of a radionuclide for which there is presumptive evidence to make a "tentative identification."
R	Indicates that the sample results for the radionuclide are rejected or unusable due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the radionuclide cannot be verified.

Data Validation Reason Codes

Holding Times

A03 Analysis holding times were exceeded.
A04 Analysis holding times were grossly exceeded.
A05 Samples were not preserved properly.
A06 Professional judgment was used to qualify the data.

Blanks

F01 Sample data were qualified as a result of the method blank.
F02 Sample data were qualified as a result of the field blank.
F03 Sample data were qualified as a result of the equipment rinsate.
F04 Sample data were qualified as a result of the trip blank.
F05 Gross contamination exists.
F06 Concentration of the contaminant was detected at a level below the CRQL.
F07 Concentration of the contaminant was detected at a level less than the action limit, but greater than the CRQL.
F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

DATA VALIDATION REPORT

Date:
3 July 2008

F08 Concentration of the contaminant was detected at a level that exceeds the action level.
F09 No laboratory blanks were analyzed.
F10 Blank had a negative value >2x's the IDL.
F11 Blanks were not analyzed at required frequency.
F12 Professional judgment was used to qualify the data.

Surrogate/Radiological Chemical Recovery

G01 Surrogate/radiological chemical recovery was above the upper control limit.
G02 Surrogate/radiological chemical recovery was below the lower control limit.
G04 Surrogate/radiological chemical recovery was zero.
G05 Surrogate/radiological chemical recovery was not present.
G06 Professional judgment was used to qualify the data.
G07 Radiological chemical recovery was <20%.
G08 Radiological chemical recovery was >150%.

Matrix Spike/Matrix Spike Duplicate

H06 Professional judgment was used to qualify the data.
H07 Radiological MS/MSD recovery was <20%.
H08 Radiological MS/MSD recovery was >160%.
H09 Radiological MS/MSD samples were not analyzed at the required frequency.

Laboratory Duplicate

J01 Duplicate RPD/normalized absolute difference (NAD) was outside the control limit.
J02 Duplicate sample results were >5x the CRDL.
J03 Duplicate sample results were <5x the CRDL.
J04 Professional judgment was used to qualify the data.
J05 Duplicate was not analyzed at the required frequency.

Target Compound Identification

M01 Incorrect identifications were made.
M02 Qualitative criteria were not met.
M03 Cross contamination occurred.
M05 No results were provided.
M07 Professional judgment was used to qualify the data.

Laboratory Control Samples (LCSs)

P01 LCS recovery was above upper control limit.
P02 LCS recovery was below lower control limit.
P03 LCS recovery was <50%.
P04 No action was taken on the LCS data.
P05 LCS was not analyzed at required frequency.
P06 Radiological LCS recovery was <50% for aqueous samples; <40% for solid samples.
P07 Radiological LCS recovery was >150% for aqueous samples; >160% for solid samples.
P08 Professional judgment was used to qualify the data.

Field Duplicate

Q01 No action was taken on the basis of field duplicate RPDs.
Q02 Radiological field duplicate normalized absolute difference (NAD) was outside the control limit.
Q03 Duplicate sample results were >5x the CRDL.
Q04 Duplicate sample results were <5x the CRDL.

Radiological Calibration

R01 Efficiency calibration criteria were not met.
R02 Energy calibration criteria were not met.
R03 Resolution calibration criteria were not met
R04 Background determination criteria were not met.
R05 Quench curve criteria were not met.
R06 Absorption curve criteria were not met.
R07 Plateau curve criteria were not met.
R08 Professional judgment was used to qualify the data.

Radiological Calibration Verification

S01 Efficiency verification criteria were not met.
S02 Energy verification criteria were not met.
S03 Resolution verification criteria were not met
S04 Background verification criteria were not met.
S05 Cross-talk verification criteria were not met.
S06 Professional judgment was used to qualify the data.

Radionuclide Quantitation

T01 Detection limits were not met.
T02 Analytical uncertainties were not met and/or not reported.
T03 Inappropriate aliquot sizes were used.
T04 Professional judgment was used to qualify the data.
T05 Analytical result is less than the associated MDA, but greater than the counting uncertainty.
T06 Analytical result is less than both the associated counting uncertainty and MDA.
T07 Negative analytical result where the absolute value exceeds 2x the associated MDA.

System Performance

V01 High background levels or a shift in the energy calibration were observed.
V02 Extraneous peaks were observed.
V03 Loss of resolution was observed.
V04 Peak-tailing or peak splitting that may result in inaccurate quantitation were observed.
V05 Professional judgment was used to qualify the data.

[1]DA = apparent diffusivity; formula was obtained from USEPA, 1996. Soil Screening Guidance: User's Guide. Publication 93 [3]The following chemical-specific values obtained from the following sources:

[2]Values for the following soil physical parameters obtained from:

USEPA, 2002. *Supplemental Guidance Developing Soil Screening Levels for Superfund Sites, Appendix C.* OSWER 9355.4-24. December 2002.

θ_a = air filled porosity (L_{air}/L_{soil}) = 0.28 for surface soil, 0.13 for subsurface soil

θ_w = water-filled porosity (L_{water}/L_{soil}) = 0.15 for surface soil, 0.30 for subsurface soil

n = total soil porosity (L_{pore}/L_{soil}) = 0.43

ρ_b = dry soil bulk density (g/cm^3) = 1.5 g/cm^3

ρ_s = soil particle density (g/cm^3) = 2.65 g/cm^3

D_i = diffusivity in air (cm^2/sec) from EPA 2002 or RAIS website (http://rais.ornl.gov)

ND = no data; physical/chemical parameters not available for all chemicals

USDOE, 2007. *Risk Assessment Information System* (Last Updated May 2007) (http://rais.ornl.gov/).

D_i = diffusivity in air (cm^2/sec), chemical specific

H' = Henrys law constant, unitless, chemical specific

D_w = diffusivity in water (cm^2/sec), chemical specific

Kd = soil-water partition coefficient, (cm3/g), chemical specific (see Appendix C, Table 8)

Appendix C: Table 11

			Pathway total risk	=	**2.6E-06**			Pathway total HI	=	0.36
Firing Site 6 Totals										
RDX			Sum of all pathway risks	=	**4.0E-06**			Sum of all pathway HIs	=	0.034
2,4,6-Trinitrotoluene			Sum of all pathway risks	=	**1.2E-05**			Sum of all pathway HIs	=	**2.5**
Aluminum			Sum of all pathway risks	=	NA			Sum of all pathway HIs	=	0.16
Chromium			Sum of all pathway risks	=	**2.2E-06**			Sum of all pathway HIs	=	**1.4**
	Total Carcinogenic Risk					Total Noncarcinogenic Risk (HI)				
	All Pathways and Chemicals			=	**1.8E-05**	All Pathways and Chemicals			=	**4.1**

DI = Chemical Daily Intake; from Tables
SF = Cancer Slope Factor; from Tables
CR = Cancer Risk
RfD = Noncancer Reference Dose; from Tables
HQ = Hazard Quotient
HI = Hazard Index (i.e., sum of HQs)
ND = no data
NA = not applicable

Bold indicates carcinogenic risk exceeding 1E-06 and noncarcinogenic risk (HQ or HI) exceeding 1.0.
[NOTE: Chemical totals for noncarcinogenic risk (HI) are presented for illustative purposes only. It may not be appropriate to consider HIs for HQs summed over COPCs that represent adverse health effects for differng target organ effects.]

COC No.: SA 10312006-015

Task Team Members: Eric Danielson, Keith Vincent

Sample ID: IAAP96883 Station ID: IAAP69883

Collection Date: 10/23/06 Collection Time: 1350

Property Name: Yard C Sample Location: (also spot just (S) of two culverts and just (S) of Bldg C3

Northing (units): 90941.64 Easting (units): 693200.29

Elevation (units): ~~693200.29~~ KAV 10/23/06 N/A Sample Type: Grab

Sample Collection Method: ~~Grab~~ KAV 10/25/06 Trowel Sample Depth: 0" to 6"

Soil Type: Light brown, silt, some clay some sand, trace gravel Moderately Plastic KAV 10/23/06 Low Plastic Rad Screen Instrument: N/A

Rad Screen Bkg. (cpm): KAV 10/23/06 N/A Rad Screen (cpm): N/A

Comments: Metals (TAL); explosives

Recorded by: Keith Vincent QA by: MStelmack Date: 11-7-06

[redacted]

COC No.: SA 10312006-015

Task Team Members: ED, KV,

Sample ID: IAAP96892 Station ID: IAAP96892

Collection Date: 10/23/06 Collection Time: ~~1415~~ RS 10-24-06 1415

Property Name: YARD C Sample Location: In ditch East of R.R. tracks (E) 100 feet (N) of C1 Immediately adjacent to culvert

Northing (units): 91240.08 Easting (units): 693198.15

Elevation (units): N/A Sample Type: Grab

Sample Collection Method: ~~Grab~~ KAV 10/26/06 Trowel Sample Depth: 0" to 6"

Soil Type: Medium Brown soil with slight aggregate. Medium plasticity Rad Screen Instrument: NA

Rad Screen Bkg. (cpm): N/A Rad Screen (cpm): NA

Comments: (33) Metals (TAL); Explosives

Recorded by: Keith Vincent QA by: MStelmack Date: 11-7-06

COC No.: SA 10312006-015

Task Team Members: ED, KV

Sample ID: IAAP 96893 Station ID: IAAP 96893

Collection Date: 10/23/06 Collection Time: 1435

Property Name: YARD C Sample Location: In cattail ditch (E) of R.R. tracks. 20 feet (S) of (N) Fence

Northing (units): 91241.16 Easting (units): 693333.54

Elevation (units): N/A Sample Type: Grab

Sample Collection Method: ~~Grab~~ KAV 10/25/06 Trowel Sample Depth: 0" to 6"

Soil Type: Saturated Silty soil with lots of Organic matter, characteristic organic odor, medium brown; medium plastic Rad Screen Instrument: NA

Rad Screen Bkg. (cpm): N/A Rad Screen (cpm): NA

Comments: (34) Metals (TAL); Explosives

Recorded by: Keith Vincent QA by: MSteiner Date: 11-7-06

COC No.: SA 10312006-015

Task Team Members: ED, KV

Sample ID: IAAP 96889 Station ID: IAAP 96889

Collection Date: 10/23/06 Collection Time: 1450

Property Name: YARD C Sample Location: Immediately adjacent to loading dock C14

Northing (units): 91088.45 Easting (units): 693460.77

Elevation (units): N/A Sample Type: Grab

Sample Collection Method: ~~Grab~~ KW 10/26/06 Trowel Sample Depth: 0" to 6"

Soil Type: Medium brown, sandy silt w/ some gravel. Low plasticity Rad Screen Instrument: NA

Rad Screen Bkg. (cpm): N/A Rad Screen (cpm): NA

Comments: (30) Metals (TAL); Explosives

Recorded by: KV QA by: MSteiner Date: 11-7-06

Sample ID: IAAP 100 153 | Station ID: IAAP100 153

Collection Date: 4/15/07 | Collection Time: 1750

Property Name: Firing Sites | Sample Location: Immed. east of road bridge that crosses creek that runs through FS area.

Northing (units): 89856.40 | Easting (units): 688109.14

Elevation (units): NA | Sample Type: Homog. Grab

Sample Collection Method: Trowel | Sample Depth: 0"-6"

Soil Type: Saturated brown medium-fine sand w/trace of gravel. | Rad Screen Instrument: 44-9 "L"

Rad Screen Bkg. (cpm): 46cpm | Rad Screen (cpm): 44cpm

Comments: #168 on prelim. map

Recorded by: [redacted] | QA by: C Boris | Date: 5/14/07

COC No.: SA04172007-025

Task Team Members: J. LAWSON

Sample ID: IAAP100123 | Station ID: IAAP100123

Collection Date: 04/15/07 | Collection Time: 1100

Property Name: IAAAP Lime Area | Sample Location: NE Corner of Bldg. 1-052

Northing (units): 93012.08 | Easting (units): 691874.49

Elevation (units): N/A | Sample Type: Homograb

Sample Collection Method: Trowel | Sample Depth: 0-0.5'

Soil Type: Brown silty clay w/ gravel | Rad Screen Instrument: NA

Rad Screen Bkg. (cpm): NA | Rad Screen (cpm): NA

Comments: Boundary sample for IAAP97001.

~1430 Ann received a call from Eric @ St. Louis office asking how long to collect about 19 samples @ West Burn Pad South of Road. Est 1 day. Then thought about labels, jars, etc. Attempted to contact someone in St. Louis office who could make labels and send them Fed Ex Blackberry's did not work, so it was decided to go to the motel to a computer. Gary tried to access the W: drive to take care of labels and then call Matthew to work with it to print the labels but this attempt failed.

~1500 est time left base to go to motel for computer access @ motel ~ 1510

1600 Give up trying to get on W: drive. Decided not to go back to the site today

1630 GMN gets ice for samples - add to existing ice pack.

1710 GMN calls Eric for guidance on locations sampled to depth. ? Eric to get back w/ tomorrow morning as far as which locations, how deep, sample interval etc. Eric told ~ 1/2 way through sample collection. End conversation ~ 1720.

1730 Collect Rinsate Blank using stainless steel trowel and bowl. Run DI water over trowel and catch in bowl before filling bottles. Collect the following: 1L amber - SVOC+MOCA; 1L amber - Explosives; & 250ml poly for TAL metals. Sample time 1730, sample ID IAAP053020007-RB1. GMN 6/1/07

Summary: Collected 19 primary soil samples, 1 duplicate (1 split), 1 MS, & 1 MSD. Collected a rinsate blank (2-1L ambers & 250ml poly). GMN 6/1/07 (19) (0) Accounts for discarded samples

Explosives SVOC+MOCA TAL metals

Eric Danielson

Narrative (include time and location):

At office

Eric D. contacts USACE (Ron Ferker sp?) to verify the number of samples collected and the types of analyses to test the samples. Ron called Eric back w/ list of samples to submit to the lab which included all prime & duplicate samples ~~to be~~ collected, only one rinsate blank for metals, one RB for explosives, & 1 RB for PCBs. 19 DU samples were to go to FUSRAP lab. Ron okayed taking the samples to STL for analysis

late am – Ron F of USACE ~~called Eric back to~~ told Eric D. not to send the samples to STL for analysis because the USACE did not have the funding secured for the analysis of samples. This was imparted to Eric when Eric called Ron to tell him that the no. of explosive samples collected was 56 rather than 55. Totals to be analyzed include: 64 TAL metals, 56 explosives, 2 PCBs, 3 dups for TAL metals 3 dups for explosives, and Equipment Rinsate Blanks for TAL metals, explosives, and PCBs. Ron did not say what to do with the 3 split samples.

Note: @ about 1530 GMN went to HISS lab for keys to HISS barn where a climate controlled refrigerator resides. COCs were completed and chem. samples were stored in the refrigerator. The DU sample cooler was left next to the frig w/ a COC taped to

TASK TEAM ACTIVITY LOG SHEET

PROJECT NAME: RI for Line 1, Firing Sites Area, Yard C, G, and L, Warehouse 3-01, and the West Burn Pads Area South of the Road

CONTRACT NO: W912P9-06-D-0534

Date (mm/dd/yy): 10/30/06 10/31/06 Su (M) (Tu) W Th F Sa PAGE 1 OF 1

Task Team Members:

Gary Neutzling 10/31/06

David Lawson 10/31/06

Melissa Steiner 10/30/06

11/14/06

Narrative (include time and location):

M 10/30/06 Melissa Steiner goes to the HISS barn to scan the DU samples in the cans in the morning.

~1300 Melissa goes to the HISS barn to scan the soil samples from the Firing sites only in preparation of taking the soil samples to STL whenever the USACE confirms that funding is in place for sample analysis.

~1500 Ron Ferker of USACE calls Eric Danielson to inform him that funds are in place for sample analysis @ STL. DO 23 on Severn-Trent Contract DACW43-02-D-5123 in place for Chemical and rad analysis. Authorized quantities include: TAL metals (23 metals) – 68 samples (64 prime, 3 dups, 1 RB); PCB (Method 8082) – (3 samples) – (2 prime, 1 RB); 60 explosives (56 prime, 3 dups, 1 RB) – (Method 8330).

Tues 10/31/06 G. Neutzling & D. Lawson go to HISS barn after stopping @ HISS lab for keys @ about 0845. Double checked COCs and gave the lead COCs a number (unique). The various soil samples and one set of water samples were removed from the locked temperature controlled refrigerator and placed in a cooler having ice bags. The coolers were not sealed because they were immediately delivered to STL for analysis. Arrived @ Lab (STL) ≈ 0945. Samples (3 coolers) relinquished @ 1000.

NOTE: The three soil samples designated as split samples have still at the HISS barn because an alternate independent lab has not been selected by the USACE as yet. Also remaining @ the HISS barn are 2 rinsate equipment blanks from 10/24/06 in the pm (1655) and 10/25/06 in the pm (1650) [TAL metals, explosives & DU] The 10/24/06 @ 1655 was to be analyzed for TAL metals & Explosives.

Note: The DO # for the project is 23 (written on COC forms). The following COC #'s were used for the COCs submitted to STL.:

GMN 11/8/06

Narrative (include time and location):

D Lee (SAIC Chemist) received word from Ron Ferker of USACE that the split samples collected during the week of 10/23/06 can be submitted to the QC lab (USACE; Omaha, NE laboratory) for analysis of metals and explosives.

1530 GMN to HSS lab for keys to HSS Barn, then on to HSS Barn. Gather 3 split samples and COC and package them in a small cooler for FedEx shipment. (tracking no. 791 1635 27928).

A dll analysis was mistakenly left on the COC and the lab POC (Deanna Percifield) was notified @ ~1700 and the following morning (11/9/06) – both times left voice message to delete the DLL analysis. Returned keys to HSS lab, copied COC for record.

1635 @ FedEx – drop off package.

The COC-identification No. is SA11082006-01X

11/17/06

Narrative (include time and location):

12:30 Final packaging of samples complete by 1315
1415 Travel to Severn Trent Lab for analysis. Have Jill Clarke sign the COCs and copy them for me. (signed 1440).
1450 Travel to the HISS barn to drop off 2 sets of equipment rinsate blanks [IAAP111406-RB & IAAP111506-RB] and three QA samples [IAAP96964-2, IAAP96979-2, & IAAP96956-2] and place them in a temperature controlled refrigerator that is locked. A COC was left with the samples for identification. The QA samples will be held until Eric Davidson can speak with the client (Ron Frenker of USACE-SFL) regarding their analysis. Contact is expected on Monday 11/20/06.

11/20/06

Narrative (include time and location):

a.m. Ron Frerker of the USACE contacted Eric Danielson to inform him of which split samples are to be analyzed. Of the three split samples collected Ron authorized the analysis of Samples IAAP96964-2 collected on 11/13/06 @ 1318 and IAAP96979-2 collected on 11/14/06 @ 0813 for TAL metals, explosives and SVOCs. The remaining soil sample IAAP96956-2 collected on 11/15/06 @ 0958 would not be analyzed for explosives and SVOCs as collected.

M&O GMN to HESS barn to pick up surface soil split samples to be analyzed. The remaining sample was left in the controlled cooler. The two samples were placed on ice in a small cooler and shipped to the USACE laboratory in Omaha, Nebraska. to the attention of Ms. Laura Percifield. The samples were taken to FedEx for shipment. The FedEx Tracking no. is 7922 4362 2102. COC ID NO. SA112020006-01X

M&O Back @ office.

1/19/07

Narrative (include time and location):

0730 Eric Danielson e-mails GMN saying that it is approved to send the split samples from site visit #3 (Dec 18 through Dec 20) to the USACE lab in Vicksburg, MS. Ron Ferker @ USACE-SPL supplied the mailing address and contact person's name but no phone number.
NOTE: This week would be the 4th week after the soil was sampled. Only metals is within the allotted holding time. Analyses to be performed included metals, SVOCs, PCBs, and Explosives.
1030 GMN checks for COC and finds that it is prepared but needs a revision to include the new lab address, contact person and phone number. The lab was USACE - Omaha and now is USACE ERDC in Vicksburg, MS. New contact is Ms Allyson Harrison @ (601) 634-4296. The address is USACE ERDC; 3909 Halls Ferry Rd.; Vicksburg, MS 39180-6199.
1300 Travel to HISS barn where the three split samples are being kept in the 4°C temperature controlled refrigerator. Collect samples, and get a bag of ice, and return to the office to package the samples for FedEx shipment.
1320 Package (1) to Bonnie for FedEx pickup from office.
1400 Contacted Allyson H. @ lab to alert her of Saturday delivery and gave her the FedEx tracking No. 8553 8406 7352. She said that the guard gate would likely end up w/ the samples and that she would drop by the office to retrieve the package and place it in the receiving refrigerator. Sample IDs are as follows: IAAP97001-2, IAAP98247-2, and IAAP98258-2. having sample times of 1555, 1426, and 0936, respectively.
